SEVA FIRST INNOVATION CHALLENGE 2026

SCREEN-1 • IDEATION

Cyber Scam Awareness Trainer
with AI-Assisted Scam Checker

Learn to spot warning signs. Check suspicious content more safely.

PARTICIPANT

Neelaksh Suman
Swami Keshwanand Institute of Technology Management and Gramothan

ENTRY

Category II: Diploma & Higher Education • Individual entry

Problem, Observation & Beneficiaries

A practical digital-safety problem with a clear community focus

PROBLEM

SMS, emails, links and QR codes can imitate trusted organisations or hide risky destinations.

WHO IS AFFECTED

People of all ages—from teenagers and students to working adults, parents, senior citizens and small-business owners—who use phones, messaging, online banking or digital payments.

Calendar year 2025: 24,02,579 financial cyber-fraud complaints were reported, involving about ₹22,495 crore in reported losses.

WHERE OBSERVED

Cyber scams can be encountered across India—in homes, schools and colleges, workplaces, shops and online communities. People of every age group may receive fake calls, messages, links or QR codes. As digital payments and online services are widely used, awareness and safe checking tools are important. Add your own genuine local observation if available.

EVIDENCE & INTERACTION

Evidence: use the official national figures in “Who Is Affected” and, if available, add a redacted scam-message example or genuine local feedback. Do not invent interviews, surveys or personal experiences.

BEFORE SUBMISSION

SOURCES: Ministry of Home Affairs / I4C, NCRP & CFCFRMS (calendar-year 2025 financial-fraud complaints and reported losses). A separate full-year FY 2025–26 total was not confirmed in the cited official source.

Existing Solutions & What Is New

Explain the gap honestly and validate it with evidence

EXISTING OPTIONS

Awareness articles/videos and standalone URL reputation checkers.

GAP TO VALIDATE

Learning and checking may be separate; users may need plain-language explanations.

OUR DIFFERENCE

One guided learning journey, scenario-based practice, explainable warnings and safe next steps.

PLANNED DIFFERENTIATORS

- Beginner, intermediate and advanced learning paths, with quizzes and simulated scam scenarios
- Learning-progress dashboard for completed modules and quiz scores
- URL, screenshot and QR checks with explanations—not just a red/green result
- Privacy-aware design; no claim of 100% scam detection

Proposed Solution & Conceptual Model

A single learning-and-checking workflow

01 LEARN

Beginner, intermediate and advanced lessons; quizzes and simulated scam scenarios.

02 SUBMIT

Paste a URL or upload an SMS/email screenshot or QR-code image.

03 ANALYSE

Inspect URL signals/reputation; extract screenshot text and links; decode QR destination—without visiting links automatically.

04 EXPLAIN

Show a cautious risk band, warning signs, reasons and safe next steps.

LEARNING DASHBOARD

Track modules completed, quiz scores and progress across levels.

SAFETY & PRIVACY

Never request passwords, OTPs or bank details. Minimise storage and disclose third-party processing.

Conceptual model only — features are planned, not yet a working prototype. Risk labels are not guarantees.

Technology, Cost & Expected Benefits

Feasibility, resources and measurable outcomes

TECHNICAL APPROACH

Google AI Studio for development assistance; web interface; URL inspection; OCR and QR decoding; optional reputation source.

RESOURCES / FACILITIES

Computer or phone, internet, development tools, safe test examples; optional API/service access.

APPROXIMATE COST

To be finalised after tool selection.

EXPECTED BENEFITS & MEASUREMENT

- Improve recognition of warning signs — compare pre/post quiz results
- Encourage safer decisions — measure task completion and user feedback
- Test explanations against a curated set of safe, labelled examples

75-Day Work Plan & Milestones

Adjust the dates to the official schedule and your available time

DAYS 1–10 • VALIDATE

Sources, user feedback and scope

DAYS 11–20 • DESIGN

Wireframes, learning levels, content and privacy plan

DAYS 21–35 • BUILD CORE

Lessons, quizzes, dashboard and basic URL checks

DAYS 36–50 • ADD INPUTS

Screenshot OCR/link extraction and QR decoding

DAYS 51–62 • TEST

Safe examples, usability and fixes

DAYS 63–75 • DEMONSTRATE

Evaluate, document limits and prepare demo

Team, Readiness & Key Risks

Individual entry with a staged, testable implementation plan

TEAM & ROLES

Neelaksh Suman
Planned roles: research, design, development, testing and presentation.

ENTRY TRL

Current status: concept formulated. Target: build and test a working prototype before the final demonstration; update TRL based on actual progress.

DEVELOPMENT STATUS

Solo development planned. Confirm the tools and any external services needed during implementation; list support only if it is actually used.

KEY RISKS & MITIGATION

- False results → cautious labels, safe test examples and clear limitations
- Sensitive uploads → minimise storage and disclose third-party processing
- API cost/access → review terms early and keep a basic rule-based fallback
- Solo workload → prioritise the core learning, URL, screenshot and QR workflow

Final check: replace/remove placeholders; verify the Category II template and portal deadline.
